

Assignment-based Subjective Questions

Question 1. From your analysis of the categorical variables from the dataset, what could you infer about their effect on the dependent variable? (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: <Your answer for Question 1 goes below this line> (Do not edit)

Categorical variables like season, weathersit, holiday, and workingday impact bike demand. Higher demand is seen in spring/summer and clear weather, while holidays and bad weather reduce demand.

Question 2. Why is it important to use **drop_first=True** during dummy variable creation? (Do not edit)

Total Marks: 2 marks (Do not edit)

Answer: <Your answer for Question 2 goes below this line> (Do not edit)

drop_first=True avoids multicollinearity by dropping one category, allowing the remaining categories to be interpreted in relation to a baseline.

Question 3. Looking at the pair-plot among the numerical variables, which one has the highest correlation with the target variable? (Do not edit)

Total Marks: 1 mark (Do not edit)

Answer: <Your answer for Question 3 goes below this line> (Do not edit)

temp has the highest positive correlation with cnt, indicating that warmer temperatures increase bike demand.

Question 4. How did you validate the assumptions of Linear Regression after building the model on the training set? (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: <Your answer for Question 4 goes below this line> (Do not edit)

Model assumptions were validated by: checking scatter plots for linearity, histogram/Q-Q plot for normality of residuals, residuals vs. fitted values for homoscedasticity, and VIF for multicollinearity

Question 5. Based on the final model, which are the top 3 features contributing significantly towards explaining the demand of the shared bikes? (Do not edit)

Total Marks: 2 marks (Do not edit)

Answer: <Your answer for Question 5 goes below this line> (Do not edit)

The top 3 features impacting bike demand are temp, season_summer, and yr, with temperature and seasonal patterns strongly influencing usage.

General Subjective Questions

Question 6. Explain the linear regression algorithm in detail. (Do not edit)

Total Marks: 4 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 6 goes here>

Linear regression models the relationship between variables by fitting a line that minimizes residuals. It assumes linearity, normality, homoscedasticity, and no multicollinearity.

Question 7. Explain the Anscombe's quartet in detail. (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 7 goes here>

Anscombe's quartet includes four datasets with similar summary stats but different distributions, illustrating the need for data visualization.

Question 8. What is Pearson's R? (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 8 goes here>

Pearson's R measures linear correlation, ranging from -1 to +1. Values close to ± 1 indicate strong correlations, while values near 0 suggest no linear relationship.

Question 9. What is scaling? Why is scaling performed? What is the difference between normalized scaling and standardized scaling? (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 9 goes here>

Scaling makes features comparable. Normalization scales values to [0,1], while standardization centers data around 0 with a standard deviation of 1.

Question 10. You might have observed that sometimes the value of VIF is infinite. Why does this happen? (Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 10 goes here>

VIF is infinite when perfect multicollinearity exists, meaning a predictor is exactly correlated with others. This issue can be resolved by removing redundant variables.

Question 11. What is a Q-Q plot? Explain the use and importance of a Q-Q plot in linear regression.
(Do not edit)

Total Marks: 3 marks (Do not edit)

Answer: Please write your answer below this line. (Do not edit)

<Your answer for Question 11 goes here>

A Q-Q plot compares residuals to a normal distribution, helping to check the normality assumption in regression, which is essential for accurate inference.
